

SUPPLEMENTAL AMENDMENT  
Serial No. 10/056,316  
Page 2 of 11

**IN THE CLAIMS**

Please amend the following claims as indicated:

1. (Currently Amended) A method for detecting a polishing endpoint, comprising:

~~providing a cell body defining an electrolyte-containing volume, wherein the electrolyte-containing volume contains at least electrolyte;~~

~~positioning a substrate in contact with a polishing pad at least partially submersed in the electrolyte;~~

~~electropolishing one or more conductive materials on the substrate;~~

~~delivering an electrical signal through the electrolyte; and~~

~~detecting at least one of an increase in a voltage and a decrease in a current of the electrical signal to determine the polishing endpoint of the electropolishing.~~

2. (Original) The method of claim 1, further comprising causing relative motion between the substrate and the pad during the electropolishing.

3. (Original) The method of claim 1, wherein electropolishing comprises removing at least a portion of the one or more conductive materials by electrochemical activity.

4. (Original) The method of claim 1, wherein electropolishing comprises delivering an electrical signal through the electrolyte between a first electrode and a second electrode, wherein only the first electrode is positionable in direct physical contact with the substrate.

5-6. (Cancelled)

SUPPLEMENTAL AMENDMENT  
Serial No. 10/056,316  
Page 3 of 11

7. (Previously Presented) The method of claim 1, wherein detecting the polishing endpoint comprises monitoring a signal characteristic of the electrical signal.

8. (Original) The method of claim 7, wherein monitoring the signal characteristic of the electrical signal comprises monitoring at least one of a voltage and a current of the electrical signal.

9. (Currently Amended) A method for detecting a polishing endpoint, comprising:

~~providing a cell body defining an electrolyte containing volume, wherein the electrolyte containing volume contains at least electrolyte;~~

~~positioning a substrate in contact with a polishing pad at least partially submerged in the electrolyte; contacting the substrate disposed on the polishing pad with electrolyte;~~

~~establishing a potential difference between a first electrode and a second electrode disposed in the electrolyte in order to produce a current through the electrolyte, wherein at least the first electrode is not disposed on a polishing surface of the polishing pad;~~

~~electropolishing one or more conductive materials on the substrate; and~~

~~detecting at least one of an increase in a voltage and a decrease in a current of the electrical signal to determine the polishing endpoint of the electropolishing.~~

10. (Currently Amended) The method of claim 9, wherein the first electrode is disposed ~~on a floor of the cell body~~ below the polishing pad.

11. (Original) The method of claim 9, wherein the polishing pad is conductive.

291079

SUPPLEMENTAL AMENDMENT  
Serial No. 10/056,316  
Page 4 of 11

12. (Original) The method of claim 9, further comprising continuing to polish the substrate for a period of time after detecting the polishing endpoint.
13. (Original) The method of claim 9, further comprising causing relative motion between the substrate and the pad during the electropolishing.
14. (Original) The method of claim 9, wherein electropolishing comprises removing at least a portion of the one or more conductive materials by electrochemical activity.
15. (Cancelled)
16. (Original) The method of claim 9, further comprising initiating a continuing polishing step upon detection of the polishing endpoint.
17. (Currently Amended) A computer readable medium containing a program which, when executed, performs an operation for detecting a polishing endpoint of an electropolishing process occurring for a substrate in contact with a polishing pad ~~at least partially submersed in the~~ and an electrolyte, the operation comprising:  
detecting the polishing endpoint of the electropolishing according to at least one of a voltage and a current of an electrical signal delivered through at least the electrolyte.
18. (Original) The computer readable medium of claim 17, wherein the electropolishing comprises relative motion between the substrate and the pad.
19. (Original) The computer readable medium of claim 17, wherein the electropolishing comprises anodic dissolution induced by the electrical signal.

291079

SUPPLEMENTAL AMENDMENT  
Serial No. 10/056,316  
Page 5 of 11

20. (Original) The computer readable medium of claim 17, wherein electropolishing comprises removing at least a portion of one or more conductive materials on the substrate by electrochemical activity.

21. (Original) The computer readable medium of claim 17, wherein the operation further comprises initiating a continuing polishing step upon detection of the polishing endpoint.

22. (Original) The computer readable medium of claim 17, wherein the operation further comprises changing a voltage value of the electrical signal after detection of a change in a slope of the electrical signal.

23. (Original) The computer readable medium of claim 17, wherein program comprises a process recipe comprising a plurality of voltage values for the electrical signal and wherein the operation further comprises selecting the voltage values according to polishing transition points.

24. (Original) The computer readable medium of claim 17, wherein the operation further comprises changing a voltage value of the electrical signal after detecting the polishing endpoint.

25. (Original) The computer readable medium of claim 17, wherein detecting the polishing endpoint comprises detecting at least one of an increase in the voltage and a decrease in the current of the electrical signal.

26. (Original) The computer readable medium of claim 25, wherein monitoring the signal characteristic of the electrical signal comprises monitoring at least one of a voltage and a current of the electrical signal.

SUPPLEMENTAL AMENDMENT  
Serial No. 10/056,316  
Page 6 of 11

27. (Original) An electro-chemical mechanical polishing system, comprising:  
a cell body defining an electrolyte-containing volume;  
a polishing pad disposed in the electrolyte-containing volume;  
a power supply configured to supply an electrical signal to an electrolyte  
contained in the electrolyte-containing volume; and  
an endpoint detection system configured to monitor an increase in a  
voltage or a decrease in a current of the electrical signal to detect a polishing  
endpoint.

28. (Original) The system of claim 27, further comprising a reference  
electrode.

29. (Original) The system of claim 27, wherein the polishing pad is  
conductive.

30. (Original) The system of claim 27, further comprising a controller operably  
connected to the endpoint detection system and configured to halt a polishing  
cycle upon detection of the polishing endpoint by the endpoint detection system.

31. (Original) The system of claim 27, further comprising a controller operably  
connected to the endpoint detection system and configured to initiate a  
continuing polishing step upon detection of the polishing endpoint by the  
endpoint detection system.

32. (Original) The system of claim 27, further comprising a controller operably  
connected to the endpoint detection system and the power supply and configured  
to change a voltage value of the electrical signal upon detection of a change in a  
slope of the electrical signal by the endpoint detection system.

SUPPLEMENTAL AMENDMENT  
Serial No. 10/056,316  
Page 7 of 11

33. (Original) The system of claim 27, further comprising a controller operably connected to the endpoint detection system and the power supply and configured to execute a process recipe comprising a plurality of voltage values for the electrical signal, wherein the controller is configured to select the voltage values according to polishing transition points.

34. (Original) The system of claim 27, further comprising a controller operably connected to the endpoint detection system and the power supply and configured to change a voltage value of the electrical signal upon detection of the polishing endpoint by the endpoint detection system.

35. (Original) The system of claim 27, further comprising an electrolyte container to provide the electrolyte-containing volume with electrolyte.

36. (Cancelled)

37. (Original) The system of claim 27, further comprising:  
a first electrode disposed in the electrolyte-containing volume and connected to a first terminal of the power supply; and  
a second electrode disposed in the electrolyte-containing volume and connected to a second terminal of the power supply.

38. (Original) The system of claim 37, wherein the first electrode is disposed on a wall of the cell body.

39. (Original) The system of claim 37, wherein the first electrode is disposed on the pad.

291079

SUPPLEMENTAL AMENDMENT  
Serial No. 10/056,316  
Page 8 of 11

40. (Original) The system of claim 39, wherein the second electrode is not disposed on the pad.

41. (Original) The system of claim 27, wherein the pad comprises an electrically conductive medium located on a polishing surface of the pad and wherein a first terminal of the power supply is electrically connected to the electrically conductive medium.

42. (Original) The system of claim 41, wherein the polishing surface is non-conductive.

43. (Original) The system of claim 41, wherein a second terminal of the power supply is electrically connected to an electrode disposed in the electrolyte-containing volume.

44-46. (Cancelled)

47. (New) An electro-chemical mechanical polishing system, comprising:  
a processing pad having an upper surface adapted to process the substrate thereon;  
an electrode disposed below the processing pad; and  
an endpoint detection system configured to monitor at least one of an increase in voltage or a decrease in current of an electrical signal passing between the electrode and a substrate positioned on the upper surface of the processing pad to detect a processing endpoint.

48. (New) The system of claim 47, further comprising a controller operably connected to the endpoint detection system and the power supply and configured to change a voltage value of the electrical signal upon detection of a change in a slope of the electrical signal by the endpoint detection system.

291079

SUPPLEMENTAL AMENDMENT  
Serial No. 10/056,316  
Page 9 of 11

49. (New) The system of claim 47, further comprising a controller operably connected to the endpoint detection system and the power supply and configured to execute a process recipe comprising a plurality of voltage values for the electrical signal, wherein the controller is configured to select the voltage values according to polishing transition points.

50. (New) The system of claim 47, wherein the pad comprises an electrically conductive medium located on a polishing surface of the pad and wherein a first terminal of the power supply is electrically connected to the electrically conductive medium.
